

# Course Specifications

Valid in the academic year 2018-2019

## Computational Biology (C003715)

Course size (nominal values; actual values may depend on programme)

Credits 6.0 Study time 165 h Contact hrs 62.5 h

Course offerings and teaching methods in academic year 2018-2019

A (semester 2)	Dutch	lecture	30.0 h
		seminar: practical PC	20.0 h
		room classes	
		project	12.5 h

Lecturers in academic year 2018-2019

Dawyndt, Peter WE02 lecturer-in-charge

Offered in the following programmes in 2018-2019

	crdts	offering
<a href="#">Master of Science in Computer Science</a>	6	A
<a href="#">Master of Science in Mathematics</a>	6	A

Teaching languages

Dutch

Keywords

Computational methods, molecular biology, genome structure, gene prediction, sequence alignment, phylogenetics, comparative genomics, gene expression analysis.

Position of the course

Where did SARS come from? Have we inherited genes from Neanderthals? How do plants use their internal clock? To what extent do bacterial species exchange genetic material? The genomic revolution in biology enables us to answer such questions. But the revolution would have been impossible without the support of powerful computational and statistical methods that enable us to exploit genomic data. Solving the current and future problems in this intriguing field requires training of a next generation of researchers that are fluent in the languages of mathematics, computer science and biology.

Discover the world of computational genomics through a number of real case studies that are worked out in Matlab/Python. These cases will allow the students to gradually work themselves into the terminology and basic principles of molecular biology, and give them a flavour of the different computational techniques used in this ever-expanding research domain. This course provides a roadmap to navigate entry to this field. It guides the students through key achievements of bioinformatics, using a hands-on approach. Statistical sequence analysis, sequence alignment, hidden Markov models, gene and motif finding and more, are introduced in a rigorous yet accessible way.

Contents

- Introduction to cell biology
- Sequence statistics
- Gene finding
- Sequence alignment
- Probabilistic sequence models (hidden Markov models)
- Genetic variation within and between species
- Evolution: natural selection at the molecular level
- Phylogenetic analysis
- Whole genome comparisons
- Gene expression patterns
- Identification of regulatory sequences

## Initial competences

An understanding of basic probability theory, algorithmic concepts and programming skills are essential. Prior experience in the Python programming language and being able to work with modules for scientific computing (numpy, scipy, matplotlib) are required. No previous knowledge of molecular biology will be assumed, as time will be spent throughout the course to elaborate on the biological background. It is primordial to have an certain interest in the biological aspects of the problem domain.

## Final competences

- 1 Understand statistical and algorithmic approaches to sequence and gene expression analysis.
- 2 Understand why and how mathematics and computer science can play a role in modern biology.
- 3 Understand and apply recent articles on genomic topics, and in particular assess the data-analysis aspects of them.
- 4 Be familiar with the standard software tools and algorithms used in computational biology.
- 5 Be familiar with problems and current and future challenges of the research domain of computational biology.
- 6 Access and manipulate real genomic data.
- 7 Report effectively about the results of a genomics analysis.

## Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

## Conditions for exam contract

This course unit cannot be taken via an exam contract

## Teaching methods

Lecture, project, seminar: practical PC room classes

## Extra information on the teaching methods

Guided practical sessions in PC room, with regular reporting of the executed analysis.

## Learning materials and price

Course book: Bioinformatics algorithms: an active learning approach. Active Learning Publishers. 2 volumes: ISBN-13:978-0990374619 and ISBN-13:978-0990374626.

Computing cluster with pre-installed software that is required for the practical courses. Additional material is made available through the electronic-learning environment

Minerva

- Powerpoint slides used during lectures
- (publicly) available software tools
- scientific journals related to computational biology
- informative websites

Cost: 0 EUR

## Course content-related study coaching

Algorithmic aspects of the computational biology that are touched upon during the lectures, are further illustrated by means of a series of case studies that are worked out in Matlab or Python. Some case studies are an integral part of the lectures, while others

need further elaboration by the students during practical sessions in a PC-room or as obligatory projects. The electronic learning-environment Minerva plays a central role in the guided self-learning process of the students, as it enables the exchange of feedback and additional study material between lecturer and students.

#### Evaluation methods

continuous assessment

Examination methods in case of periodic evaluation during the first examination period

Examination methods in case of periodic evaluation during the second examination period

Examination methods in case of permanent evaluation

Oral examination, report

Possibilities of retake in case of permanent evaluation

examination during the second examination period is possible

Extra information on the examination methods

Students are assessed by the combination of a series of programming assignments (permanent evaluation: 60%) and an individual project (exam: 40%).

Calculation of the examination mark

Permanent evaluation (60%) and project elaborated in exam period (40%).
