

Course Specifications

From the academic year 2017-2018 up to and including the

Marine Genomics (C003871)

Course size (nominal values; actual values may depend on programme)

Credits 3.0 Study time 75 h Contact hrs 28.0 h

Course offerings and teaching methods in academic year 2018-2019

A (semester 1)	English	seminar: practical PC room classes	12.5 h
		lecture	12.5 h
		seminar	5.0 h

Lecturers in academic year 2018-2019

De Clerck, Olivier	WE11	lecturer-in-charge
De Meester, Nele	WE11	co-lecturer
Derycke, Sofie	WE11	co-lecturer

Offered in the following programmes in 2018-2019

	crdts	offering
International Master of Science in Marine Biological Resources (main subject Applied Marine Ecology and Conservation)	3	A
International Master of Science in Marine Biological Resources (main subject Global Ocean Change)	3	A
International Master of Science in Marine Biological Resources (main subject Management of Living Marine Resources)	3	A
International Master of Science in Marine Biological Resources (main subject Marine Environment Health)	3	A
International Master of Science in Marine Biological Resources (main subject Marine Food Production)	3	A

Teaching languages

English

Keywords

Position of the course

The course deals with genome-enabled insights into the broader framework of environmental marine science. Topics within the course include evolutionary as well as functional aspects of genes, genomes and metagenomes of marine organisms from the individual to the ecosystem-level.

pre-requisites.

The course aims to provide students an introduction to the field of molecular ecology, specifically directed toward the marine environment on its organisms. The course is concerned with applying molecular population genetics, phylogenetics, as well as (meta-)genomics and (meta-)transcriptomics to traditional ecological and evolutionary questions (e.g., species diagnosis, conservation and assessment of biodiversity, quantitative genetics, heritability of traits and breeding studies, and questions of behavioral ecology).

Contents

The course is divided in modules which outline the use of genomic approaches, from the ecosystem-level, gradually narrowing to species-, population and individual -levels. Theoretical aspects and commonly used techniques will be demonstrated using examples and practical exercises from the marine environment.

- Community-level addresses the use of genome data in assessing community structure of marine ecosystems. Techniques discussed include amplicon sequencing, qPCR, metagenomics (+ metatranscriptomics, metaproteomics, metabolomics).
- Species-level offers an introduction to sequence alignment techniques,

phylogenetics, species-delimitation, and phylogeography.

c) Population-level addresses the factors influencing population structure such as genetic drift, dispersal, mutation and selection. These aspects will be addressed using traditional organelle (mtDNA) and co-dominant markers (e.g. microsatellites) as well as NGS-based genome reduction techniques (Radseq, GBS). Aspects of speciation in the marine realm will be addressed also.

d) Individual-level: Heritability of physiological and morphological traits will be addressed using quantitative genetics, in combination with genome scans, QTL analyses and RNA-seq.

Initial competences

Bachelor in sciences. Basic knowledge in ecology, evolution and genetics is highly recommended.

Final competences

- 1 The graduated student understands the ecological and evolutionary processes acting at the genomic level in populations of marine organisms.
- 2 The graduated student has a good knowledge of the terminology used in the field of molecular ecology.
- 3 The graduated students understands the underlying principles of the commonly used molecular techniques, including preservation of tissues and specimens.
- 4 The graduated student is able to make a considerate choice of molecular techniques to address specific ecologically or evolutionary questions.
- 5 The graduated student has acquired the knowledge to correctly analyse and interpret molecular datasets from the individual to the community level.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Lecture, seminar, seminar: practical PC room classes

Learning materials and price
