High Speed Photonic Components (E030630)

Valid as from the academic year 2018-2019

Due to Covid 19, the education and evaluation methods may vary from the information displayed in the schedules and course details. Any changes will be communicated on Ufora.

Course

Course size

(nominal values; actual values may depend on programme)

Credits 4.0 Study time 120 h Contact hrs 67.5 h

Course offerings and teaching methods in academic year 2020-2021

A (semester 1) English Gent group work 2.5 h

guided self-study 15.0 h

Lecturers in academic year 2020-2021

Morthier, Geert TW05 lecturer-in-charge

Verschaffelt, Guy VUB co-lecturer

Offered in the following programmes in 2020-2021

Bridging Programme European Master of Science in Photonics

European Master of Science in Photonics

4 4 A

A

English

modulation, optical pulses, optical switching

Keywords

Position of the course

To acquire a thorough understanding of the dynamics of laser diodes. To acquire an overview of the field as well as the necessary insight and skills to be able to do research or follow-up research in the field. Partly taught at UGent and partly at VUB.

Contents

• Introduction: Components, General approximations, Applications
• Laser diode descriptions: Longitudinal equations, Rate equation descriptions, Non-linear material properties
• Laser diode modulation and noise: Small signal modulation, large signal modulation, Linewidth and intensity noise, Experimental characterisation
• Non-linear laser dynamics: bifurcations, Chaos and its characterisation
• Mode locking and short pulse generation: Mode locking theory, Q-switching and self-pulsations, Characterisation of short pulses
• All-optical flip-flops: Flip-flops based on DFB lasers, Flip-Flops based on ring or disk lasers

Initial competences

• wave propagation theory, laser theory, notions of noise.

This course relies heavily on several competences acquired in the course Lasers. It is not advised to take this course without first having taken the course Lasers (or having acquired a thorough knowledge about lasers).

Final competences

1 Being able to use the rate equations for the derivation of large and small signal dynamic behaviour.
2 Being able to derive the different noise characteristics from the rate equations.
3 Understanding the different methods for the generation of short laser pulses.
4 Understanding the influence of external reflections on the laser diode behaviour.
5 Understand the context of scientific or technical documents in the field of photonics and further investigate unclear parts independently.
6 Acquire sufficient knowledge to perform research in the domain of laser dynamics.

Conditions for credit contract

(Approved)
Access to this course unit via a credit contract is determined after successful competences assessment.

Conditions for exam contract
This course unit cannot be taken via an exam contract.

Teaching methods
Guided self-study, group work, lecture.

Learning materials and price
lecture notes (jointly with VUB).

Course content-related study coaching

Evaluation methods
end-of-term evaluation and continuous assessment

Examination methods in case of periodic evaluation during the first examination period
Oral examination

Examination methods in case of periodic evaluation during the second examination period
Oral examination

Examination methods in case of permanent evaluation
Report
Possibilities of retake in case of permanent evaluation
examination during the second examination period is not possible

Extra information on the examination methods
During examination period: oral closed-book exam, written preparation. During semester: graded project reports; graded team work.

Calculation of the examination mark
Special conditions: 1 computer exercise and 1 paper. Final score depends half on the marks for these exercises (1/4th per exercise).
