

Environmental Technology: Waste (I002591)

Due to Covid 19, the education and evaluation methods may vary from the information displayed in the schedules and course details. Any changes will be communicated on Ufora.

Course size (nominal values; actual values may depend on programme)
Credits 3.0 Study time 90 h Contact hrs 30.0 h

Course offerings and teaching methods in academic year 2020-2021

A (semester 2) English Gent lecture 30.0 h

Lecturers in academic year 2020-2021

Ronsse, Frederik LA24 lecturer-in-charge
Volcke, Eveline LA24 co-lecturer

Offered in the following programmes in 2020-2021

	crdts	offering
Master of Science in Environmental Science and Technology	3	A
International Master of Science in Sustainable and Innovative Natural Resource Management	3	A
Exchange Programme in Bioscience Engineering: Environmental Technology (master's level)	3	A

Teaching languages

English

Keywords

Management of solid waste, material flows, recycling, reuse, thermal energy recovery, biological treatment processes of solid waste

Position of the course

The purpose of this course is to provide the students with the insight into the wide range of techniques to process solid wastes. Therein, emphasis is made - in decreasing order of importance - to reuse, materials reuse (recycling), energy recovery and disposal with respect to the aim of solid waste and material management. The technical and organizational aspects of waste prevention, transformation and disposal are dealt with from the environmental, legal and economical angle. The course aims to enable the students to formulate a well-reasoned answer to the waste and material reuse issues today's and tomorrow's society encounters.

Contents

1. Introduction
 - Material and waste flows, resource efficiency, linear versus circular economy
 - Waste and recycling policies: key concepts
2. Recycling and material reuse technology: physical unit processes
 - Densification and size reduction techniques
 - Sorting based on density, size, optical and IR properties, electromagnetic properties.
- Flotation and dewatering
 - Examples of some relevant recycling process designs for specific waste streams: packaging plastics and waste rubber, glass containers, e-waste, construction, demolition and wood waste.
3. Biological waste treatment processes
 - Composting
 - Anaerobic digestion
 - Biodrying
4. Thermal processing and energy recovery
 - Incineration and required flue gas treatment
 - Incinerator designs for municipal solid waste, fluid bed combustion for RDF and sewage sludge
 - Energy recovery: basic concepts
5. Landfilling

- Types of landfill
- Construction of a landfill and subsequent exploitation
- Collection of landfill gas and leachate; appropriate landfill gas valorization and leachate treatment systems
- Clean-up of disused landfill site; material reuse by landfill mining

Initial competences

Basic knowledge of chemistry, physics

Final competences

- 1 Have basic insights into solid waste material flows and their collection.
- 2 Have basic insights into the available techniques for recovery of solid waste with emphasis on maximum material reuse and/or energy recovery.
- 3 Have basic insights into the available techniques for final disposal of solid waste.
- 4 Formulate proposals to prevent, usefully reuse or dispose of a specific material or solid waste stream

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Excursion, lecture

Extra information on the teaching methods

Theory consists of lectures. Practical examples of management of specific waste or material streams are illustrated by means of company visits of which an individual report needs be written and handed in.

Learning materials and price

English lecture slides will be distributed to students. All course material, including background reading material, is distributed electronically by means of Ufora

References

Tchobanouglos, G., Kreith, F (2002). Integrated solid waste management, 2nd Ed. McGraw-Hill, Inc., New York - Williams P (2005). Waste treatment and disposal. Wiley, England.

Course content-related study coaching

The lecturer is available during and after the lectures for questioning, feedback and guidance. Additionally, the lecturer can be consulted electronically through e-mail, or personally upon making an appointment

Evaluation methods

end-of-term evaluation and continuous assessment

Examination methods in case of periodic evaluation during the first examination period

Written examination with open questions

Examination methods in case of periodic evaluation during the second examination period

Written examination with open questions

Examination methods in case of permanent evaluation

Participation, report

Possibilities of retake in case of permanent evaluation

examination during the second examination period is possible in modified form

Extra information on the examination methods

The evaluation consists of a closed-book written exam, with open questions

Calculation of the examination mark

End-of-term examination accounts for 85%. The remaining 15% of the evaluation stems for the report following (and participation in) the company visits. Students who eschew period aligned and/or non-period aligned evaluations for this course unit may be failed by the examiner.
